#### 1 Introduction

A waveguide is a structure that guides waves, such as high-frequency, high-power electromagnetic waves, with minimal loss of energy by restricting the transmission of energy in one direction. For Project 5 we are given a structure considered an infinite trough. The trough is bounded on the y axis from 0 to 1m. The x axis extends from 0 to infinity. At 0 on the x axis and all along the y axis is a voltage potential of 10 V. We are tasked to use MATLAB to effectively plot  $\phi(x,y)$ . Then change the discrete mode value to [1, 2, 5, 10, 100, 1000]. We are also tasked to plot E(x,y),  $E_x$ ,  $E_y$ , and |E|.

#### 2 Part A

First we plot  $\phi(x,y)$  with  $\Phi=10$  and b=1m. This is completed using the equation:

$$\sum_{k=1}^{N} \frac{4\Phi}{m\pi} \exp \frac{-m\pi x}{b} \sin \frac{m\pi y}{b} \tag{1}$$

Where m = 2k - 1

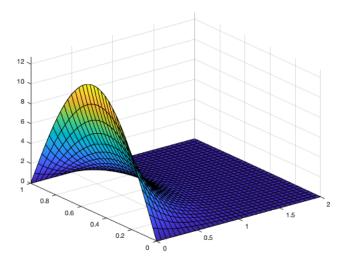

Figure 1:  $\phi$  @ N = 1

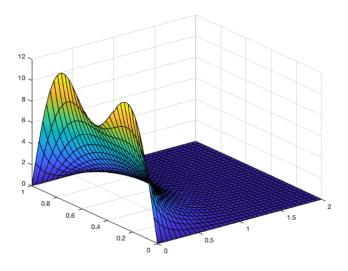

Figure 2:  $\phi$  @ N = 2

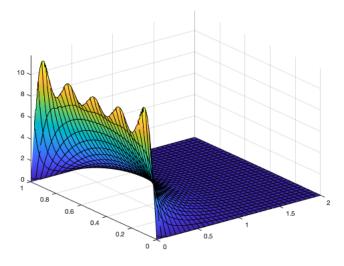

Figure 3:  $\phi$  @ N = 5

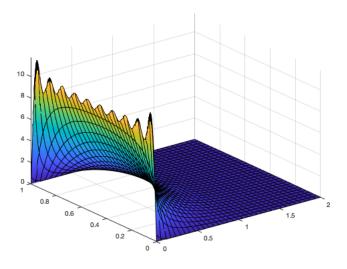

Figure 4:  $\phi$  @ N = 10

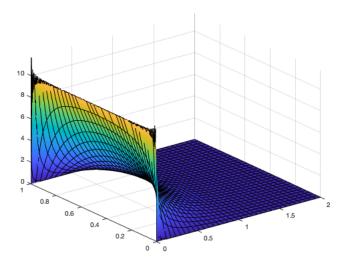

Figure 5:  $\phi$  @ N = 100

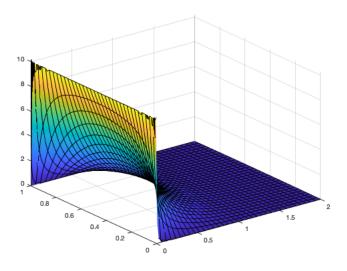

Figure 6:  $\phi$  @ N = 1000

Observing the graphs we see a half sinusoid relating to N (ie., if N=1 then we have one half a sinusoid). Continuing, we see boundary condition is continuous along  $\mathsf{x}=0$  relating to the waves bouncing off the walls of the wave guide causing standing waves to exist inside the wave-guide. As N increases the boundary problem is similar to a Fourier series by the increasing summation adds up to a "rectangle." As you increase through the x axis you can see the boundary condition is no longer needed and the wave falls to zero. The waves also range on the z axis from 8-10V the waves peak at certain points due to making a tangential for the boundary crossover.

#### 3 Part B

For part 2 we were required to plot E(x,y),  $E_x$ ,  $E_y$ , and |E|. This was done by first determining E(x,y) using equation:

$$E(x,y) = \nabla \phi(x,y) \tag{2}$$

## **3.1** E(x,y)

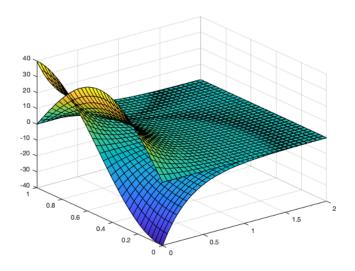

Figure 7: E(x,y) @ N = 1

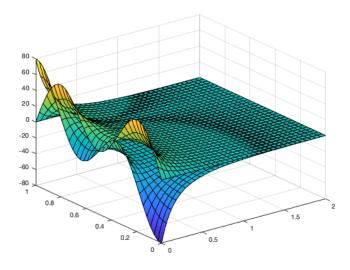

Figure 8: E(x,y) @ N = 2

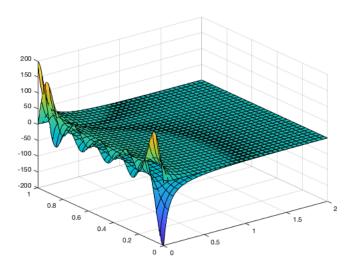

Figure 9: E(x,y) @ N = 5

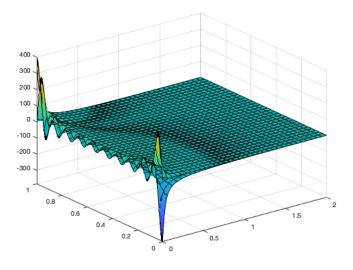

Figure 10: E(x,y) @ N = 10

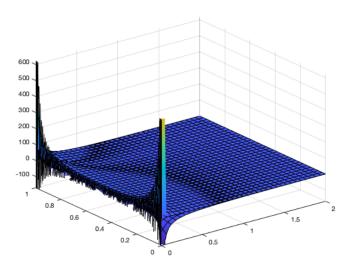

Figure 11: E(x,y) @ N = 100

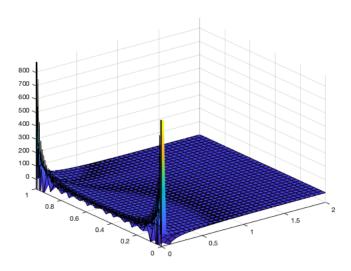

Figure 12: E(x, y) @ N = 1000

Given these graphs we are able to visualize the different modes for a transverse electric field inside of the wave-guide. We know it is transverse electric because the electric field propagates on the z axis, not the x axis/propagation axis. We can see the modes:  $TE_{10}$ ,  $TE_{20}$ ,  $TE_{50}$ ,  $TE_{100}$ ,  $TE_{1000}$ , and  $TE_{10000}$ . The intensity of the electric field is described by these graphs and explains where the electric field is most prominent. In future, I will utilize contour and quiver function as they're probably easier to read, but I ran out of time and figured these sufficed as they're very telling of the electric field activity. We see the electric field peaks at the mode peaks and the y axis extremities/ outer bounds (0 & 1).

## **3.2** $E_x$

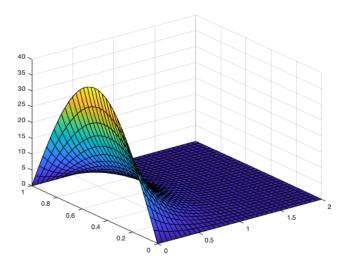

Figure 13:  $E_x$  @ N = 1

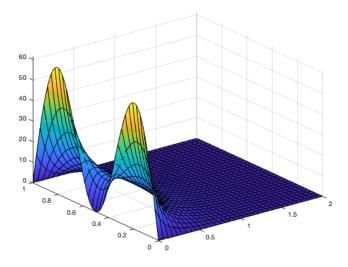

Figure 14:  $E_x$  @ N = 2

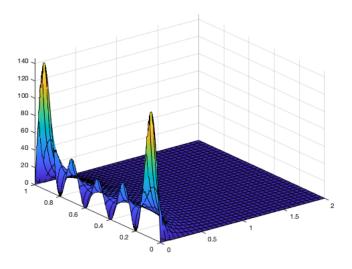

Figure 15:  $E_x$  @ N = 5

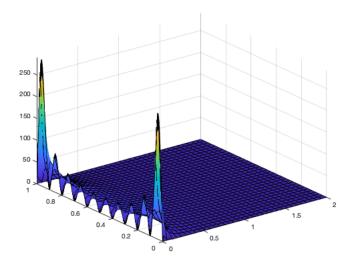

Figure 16:  $E_x$  @ N = 10

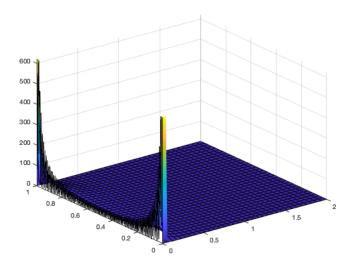

Figure 17:  $E_x$  @ N = 100

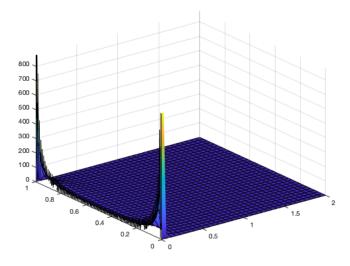

Figure 18:  $E_x$  @ N = 1000

# **3.3** $E_y$

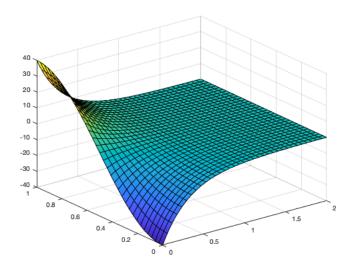

Figure 19:  $E_y$  0 N = 1

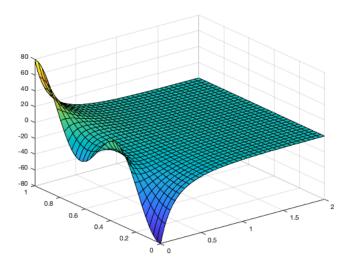

Figure 20:  $E_y$  @ N = 2

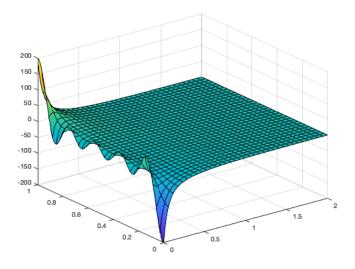

Figure 21:  $E_y$  @ N = 5

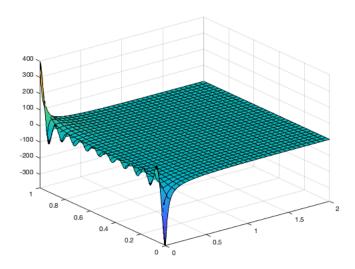

Figure 22:  $E_y$  @ N = 10

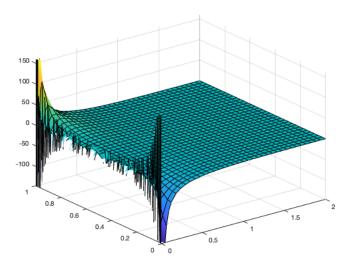

Figure 23:  $E_y$  @ N = 100

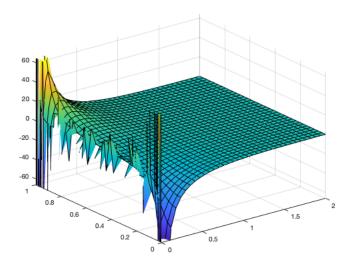

Figure 24:  $E_y$  @ N = 1000

### **3.4** |*E*|

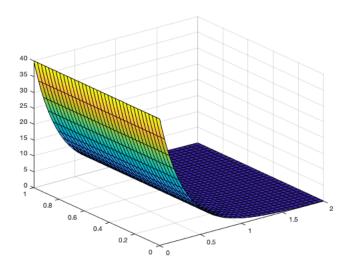

Figure 25: |E| @ N = 1

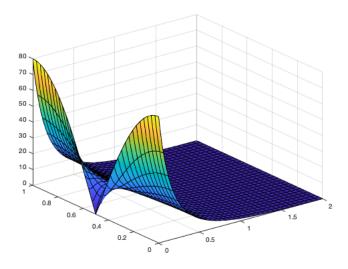

Figure 26: |E| @ N = 2

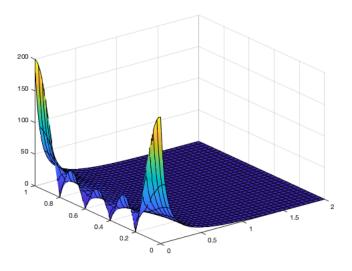

Figure 27: |E| @ N = 5

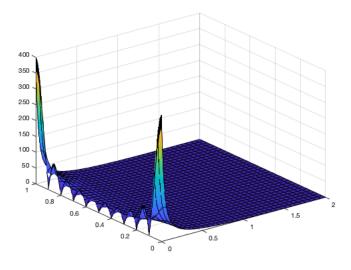

Figure 28: |E| @ N = 10

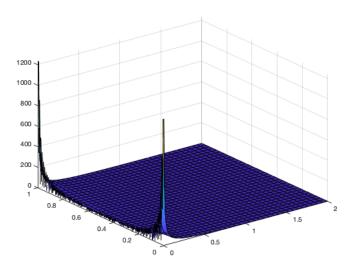

Figure 29: |E| @ N = 100

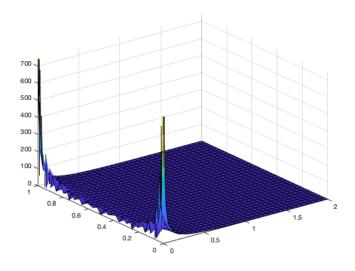

Figure 30: |E| @ N = 1000

The above graphs further describe the electric field function. I am not sure if we needed to include them, but I found them fascinating. Using the graphs we can determine the intensity of the electric field at certain areas of the wave-guide. The intensities were separated by variable x, y, and absolute value/ magnitude. The magnitude is very telling of the activity of the electric field and how it peaks towards the extremities of the wave-guide y bounds.
